

# ARTIFICIAL ROCK CLIMBING ARRANGEMENT ADAPTED FOR WATER ENVIRONMENT

## ABSTRACT

5        An artificial rock climbing arrangement includes a generally rigid  
framework removably attached to a support surface located adjacent a body of  
water. A panel structure is mounted on the framework for defining a climbing  
surface, the panel surface carrying a plurality of climbing holds. A support  
structure is secured between the framework and the support surface for maintaining  
10       the framework and the climbing surface in a substantially vertical orientation when  
a climber scales the climbing surface.
